These days’ people spend a significant amount of time surfing the Internet for information, which they believe to be safe and trustworthy. The society tends to crave instant information at the stroke of a key or tap of a button, especially when it comes to our health issues, facing very busy, stressful lives. At various times when health questions or concerns arise or some symptoms appear, people would like to expedite the diagnostic process by skipping the doctor’s office, and jumping online to self-diagnose. The research data collected indicates that millions of people visit medical sites, blogs, and Wiki-pages intentionally or unintentionally to seek for medical advices, which may lead to more confusion by the overwhelming information, and inability to distinguish the correct information from the sea of findings. This study aims to explore the issue of self-diagnosis and the related impact, and raise the awareness of the importance of seeking the right diagnosis and treatment plan from their medical provider.
