Admission Requirements

Students applying for the Western Illinois University certificate must have a cumulative undergraduate grade point average of 2.75 or higher and an undergraduate degree in Biology, Geography, or a related field. Non-degree students seeking the certificate only must meet the admission requirements for the Graduate School; students seeking both a degree and the certificate must meet the admission requirements for their degree program.

Academic Requirements

Students must have a cumulative 3.0 GPA for all coursework required for completion of the certificate. A post-baccalaureate certificate will not be awarded to a student who earns more than 3 semester hours (sh) of “C,” “D,” “F,” or “U” grades in the graduate-level courses required for the completion of the certificate. No course for which a student has received a grade of “D” or less may be used to satisfy certificate requirements. Transfer work or course substitutions are not allowed in the certificate programs. The work required for the certificate must be completed within three calendar years.

If approved by the specific academic department, courses taken to satisfy certificate requirements may be used to satisfy post-baccalaureate degree requirements at the University.

Certificate Requirements

The program requires completion of 18 sh broken into Sections I, II, and III. Section I requires completion of two core courses: GIS 405G and 509 (6 sh). Section II requires selection of one course: BIOL 452G, GIS 407G, GIS 408G, or GIS 609 (3 sh). Section III requires selection of any three courses (9 sh) from Biology; Earth, Atmospheric, and Geographic Information Sciences; Political Science; Recreation, Park and Tourism Administration; and Sociology and Anthropology.

Career Opportunities

In the environmental field, there are few jobs beyond the technician level that do not require a background in Geography Information Systems (GIS). The Illinois Department of Natural Resources, Illinois Environmental Protection Agency, U.S. Army Corps of Engineers and U.S. Fish and Wildlife Service all require their mid-level employees to be familiar with the use and application of GIS to their particular missions. Potential career opportunities include the following:

- Resource development
- Environmental consulting
- Landscaping
- Working in state and federal agencies
- Urban planning
- Industrial or urban facility and site development
- Agricultural management
- Crime mapping
- Emergency management
- Climatology

Facilities

The GIS Analysis post-baccalaureate certificate utilizes modern remote sensing/GIS computer instructional labs at the Macomb (Waggoner Hall and Tillman Hall) and Moline (WIU-QC Complex) campuses. ESRI ArcGIS software is available for classroom and individual learning, and students are provided with ArcGIS student versions for their personal computers.

The WIU Department of Earth, Atmospheric, and Geographic Information Sciences houses the GIS Center on the third floor of Tillman Hall. The center is responsible for compiling, managing and storing GIS data layers. Other facilities include a Remote Sensing/GIS lab with more than 30 computers that are fully networked and use ERDAS Imagine software. Other software includes ESRI GIS, such as ArcGIS. Additionally, the department has three wired electronic classrooms plus wireless connectivity throughout Tillman Hall.

The Alice L. Kibbe Life Science Station is a biological reserve of more than 1,600 acres of islands, bluffs and upland areas in the Mississippi River Valley near Warsaw, IL. Its aquatic habitats, forests and prairies serve as an outdoor classroom for field studies and are used in environmental research. The Cedar Glen Eagle Roost, which is adjacent to the field station, is considered one of the Midwest’s most outstanding natural areas and is nationally known as a major winter roosting area for bald eagles. The field station maintains research sites and equipment for sampling on the Mississippi River.

**Distinctive Features**

- Students will be taught correct use of GIS over a broad range of real-world problems, including both environmental (including ecological) and socioeconomic applications, many of which share similar GIS principles, methods and tools.
- There is an emphasis on a modeling-oriented GIS approach to guide students through a three-step procedure of (1) understanding and conceptualizing the problem in GIS, (2) representing the problem in GIS and (3) analyzing the problem using GIS techniques.
- Students are trained to use GIS wisely, based on a solid understanding of this science, including its principles, methodologies, tools and limitations.
