Software Description

HyperStudio is an authoring program in which cards can be created that link together to become a stack. Paint tools are available to draw a background. Predrawn art or clip art and graphics from Hyper Studio or other sources can be added. Sound can be added to the card by recording a sound, using prerecorded sound from Hyper Studio. Or access audio CD's. Text can be added to the stack. Buttons are added to the cards that become hot spots on the screen where the children can click the input device to make things happen. Quicktime movies can be inserted into the program.
